

# PSC Booking Local Sync API Documentation

## Overview

These APIs are used by the remote local server to pull booking records that still need local reconciliation. Every feed returns records where `local_sync` is not 1. This includes new records and records that were previously synced but later changed.

- The ACK endpoint uses POST `/booking/sync/response` and accepts multiple results in one request.
- ACK results are processed independently. One bad item does not fail the whole batch.
- Each sync item is identified by `booking_type` plus `booking_id`; do not use `booking_id` alone across categories.

## Standard Payload Shape

```
{
  "booking_type": "ROOM",
  "booking_id": 123,
  "booking_dets": {},
  "payment_dets": {},
  "sync_dets": {}
}
```

|              |                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| booking_dets | Booking/business data: dates, state flags, member or affiliated club identity, guest, payer, and booked resource(s).                                                                                                                                                    |
| payment_dets | Financial state: <code>base_amount</code> , <code>heads</code> , <code>heads_total</code> , <code>total_amount</code> , <code>paid_amount</code> , <code>pending_amount</code> , <code>refund_amount</code> , <code>payment_status</code> , and <code>vouchers</code> . |
| sync_dets    | Integration state only: <code>local_sync</code> , <code>local_sync_id</code> , <code>local_sync_status</code> , <code>sync_datetime</code> , and <code>local_sync_message</code> .                                                                                      |

## Heads and GST Rules

- Heads come from stored `extraCharges` JSON.
- `name` maps from `head`; `amount` maps from `amount`.
- `amount_for_gst` maps from stored `baseAmount` when present, otherwise null.
- `gst_percent` maps from stored `gstPercent` when present, otherwise 0.
- `gst_amount` maps from stored `gstAmount` when present, otherwise 0.00.
- The API does not guess or recalculate GST for older records.

## Requeue Rule

If a booking is updated after it was synced successfully, the backend sets `local_sync` back to 0. Detail updates, payment updates, cancellations, and close-booking actions make the record eligible for sync again.

## 1. Guest Room Booking Sync

|                     |                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------|
| Method              | GET                                                                                                      |
| URL                 | /booking/sync/guest-rooms                                                                                |
| Auth                | Admin web cookie/JWT auth. Route is protected by booking module update access.                           |
| Query               | Optional: limit. Default 100. Minimum 1. Maximum 500.                                                    |
| Booking type in ACK | ROOM                                                                                                     |
| Returns             | Guest room bookings with member, guest, payer, flat rooms, payment details, vouchers, and sync metadata. |

### Example request

GET https://admin.peshawarservicesclub.com/api/booking/sync/guest-rooms?limit=100

## ACK Endpoint

|               |                                                                                             |
|---------------|---------------------------------------------------------------------------------------------|
| Method        | POST                                                                                        |
| URL           | /booking/sync/response                                                                      |
| Auth          | Admin web cookie/JWT auth. Route is protected by booking module update access.              |
| Purpose       | Local server sends back success/failure for each booking it attempted to sync.              |
| Compatibility | If booking_type is missing, backend treats the item as ROOM for old guest-room ACK clients. |

### Request payload

```
{
  "results": [
    {
      "booking_type": "ROOM",
      "booking_id": 121,
      "local_sync_id": "LOCAL-ROOM-121",
      "local_sync_status": 1,
      "local_sync_message": "Stored successfully"
    },
    {
      "booking_type": "HALL",
      "booking_id": 38,
      "local_sync_id": null,
      "local_sync_status": 0,
      "local_sync_message": "Local validation failed"
    }
  ]
}
```

### ACK response format

```
{
  "status": false,
  "updated": [
    {
      "booking_type": "ROOM",
      "booking_id": 121,
      "local_sync_id": "LOCAL-ROOM-121",
      "local_sync_status": 1,
      "sync_datetime": "2026-08-13T07:30:00.000Z",
      "local_sync_message": "Stored successfully"
    }
  ],
  "failed": [
    {
      "booking_type": "UNKNOWN",
      "booking_id": 999,
      "error": "Invalid booking_type"
    }
  ],
  "data": []
}
```

## ACK Effects

|                      |                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Successful ACK       | local_sync = 1, local_sync_status = 1, local_sync_id saved, sync_datetime updated, local_sync_message saved.                                                    |
| Failed ACK           | local_sync = 0, local_sync_status = 0, local_sync_id saved if provided, sync_datetime updated, local_sync_message saved. The record remains eligible for retry. |
| Invalid booking_type | That item is reported in failed and no booking row is updated.                                                                                                  |
| Missing booking_type | The item is treated as ROOM for compatibility with the original room sync ACK.                                                                                  |
